

Macular Thickness in Glaucoma

Sanjay Asrani, MD

Associate Professor of Ophthalmology

Head, Glaucoma OCT Reading Center

Director of Education

Duke University Eye Center

Durham, North Carolina

Financial Disclosure

- I have received lecture honoraria from Heidelberg Engineering

Why should we be interested in the retinal thickness in glaucoma?

- The ganglion cell layer is multi-layered in the macular region – with RNFL, 40% of total retinal thickness
- The majority (> 50%) of the entire retinal ganglion cell population is in the macular region
- Variation in macular ganglion cell numbers is small

Curcio CA, Allen KA. J Comp Neurol 1990;300(1):5-25

The visual field relatively under-samples the macula

35 ganglion cells per size III target

10 ganglion cells per size III target

230 ganglion cells per size III target

Percentage of ganglion cell loss for 3db field loss

Asrani S, Challa P, Herndon L et al Correlation between retinal thickness analysis, optic nerve and visual fields in glaucoma patients and suspects. *J Glaucoma* 2003; 12(2):119-28

Various macular thickness parameters have been used:

- Asymmetry of Macular thickness
 - Segmented macular ganglion cell complex (GCC)
 - Increased area of the GCC measured
 - Ratio of GCC and total retinal thickness
 - Hemifield thickness

Asymmetry Analysis: compare retinal thickness measurements between eyes and between hemispheres of each eye

Asymmetry display: As gray scale of difference in thickness from 0 to - 30 microns

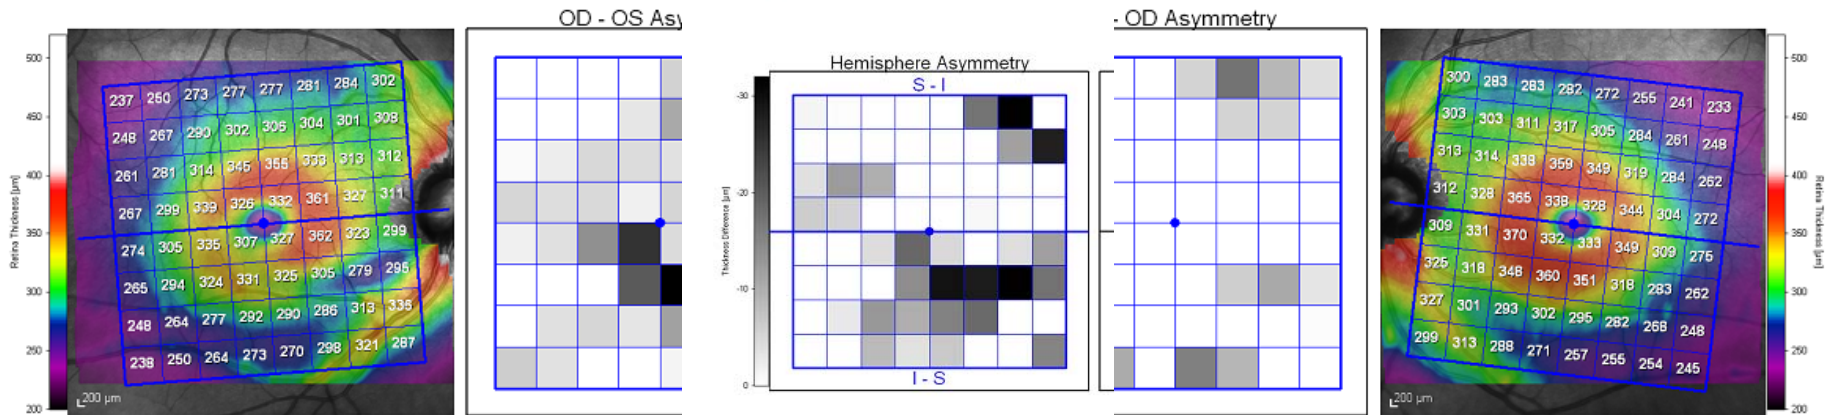

Hemisphere Asymmetry: Each small area in the lower hemisphere is compared to the corresponding area in the superior hemisphere. The fovea-to-disc axis is the horizontal symmetry line.

Asymmetry between eyes: For each small 3 x 3 area of one eye, the mean thickness is compared to the value in the corresponding area of the other eye

Warning: Classification results valid for Caucasian eyes only.

Findings from Recent Studies

- Macular GCC parameters were found to be superior to RNFL in detecting early glaucoma especially in high myopes
 - Both retinal thickness measurements as well as GCC are highly reproducible
 - Both total retinal thickness and macular GCC showed similar levels of sensitivity in progression detection and were better than RNFL parameters, especially for advanced glaucoma

Conclusions

- The high reproducibility of macular thickness holds promise for objective measurement of glaucoma progression
- Detection of glaucoma and measuring progression is made easier by combining the diagnostic potential of RNFL thickness and the modified macular thickness map
- Artifacts need to be ruled out before accepting results from any technology
- As a predictable and significant structural relationship exists between macular thickness and VF defects, such measurements should be studied further
