Disclosures: Optovue Consultant

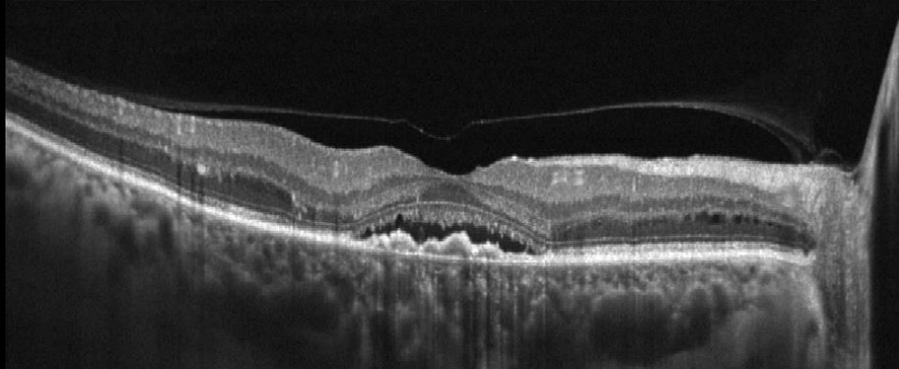

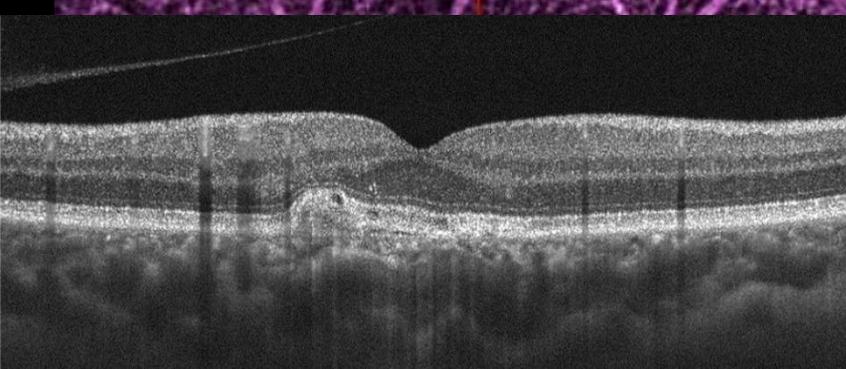

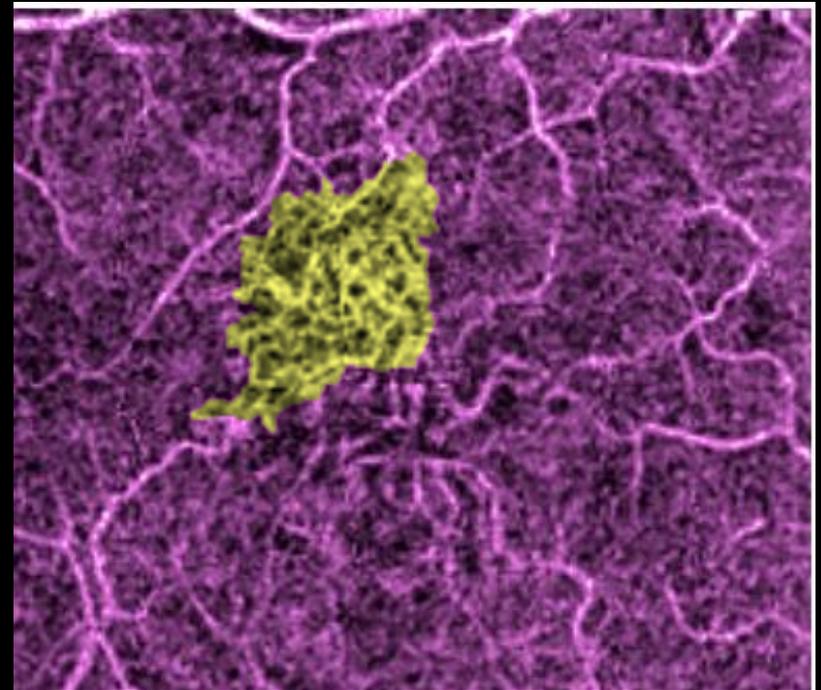

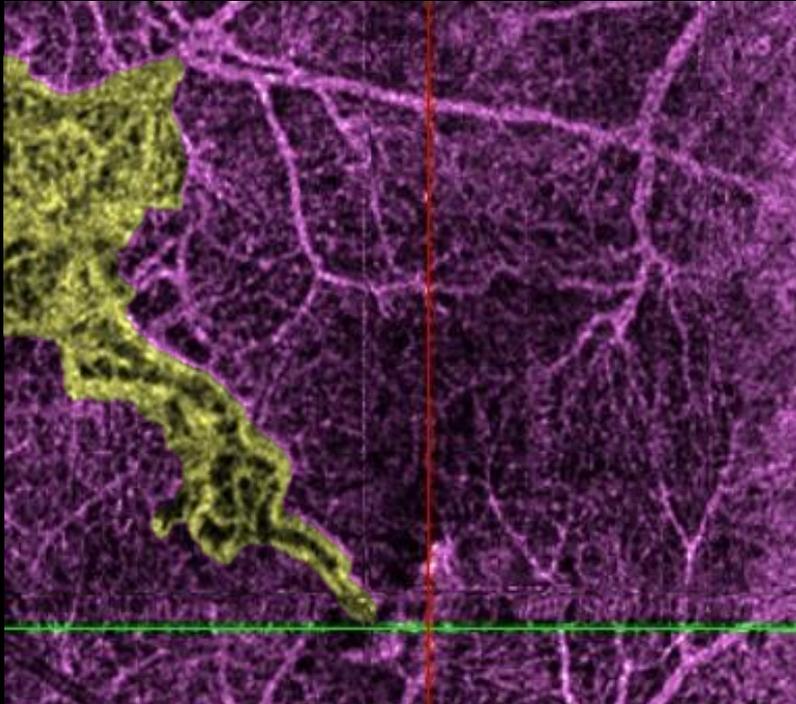

Features added on traditional FA

- OCT Angiography allows early diagnosis and classification of CNV
- OCT Angiography allows a very close follow up
- Non invasive
- No leakage masking
- Repeatable
- Fast
- Qualitative analysis
- Quantitative analysis

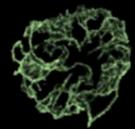

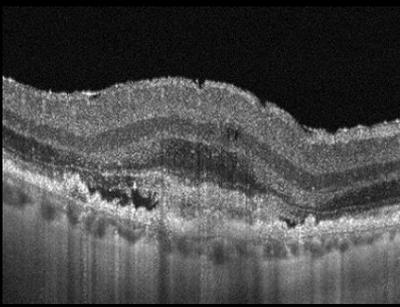

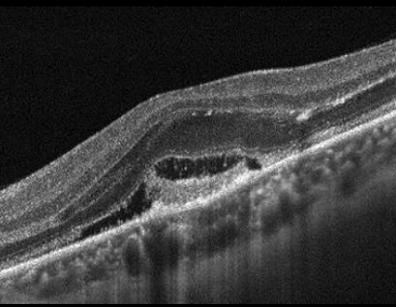

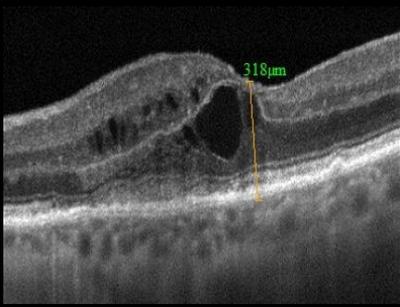

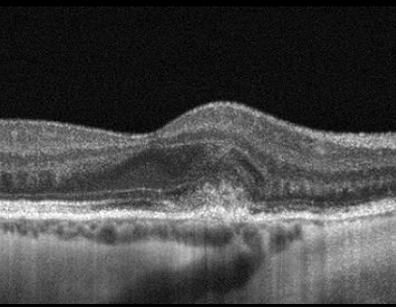

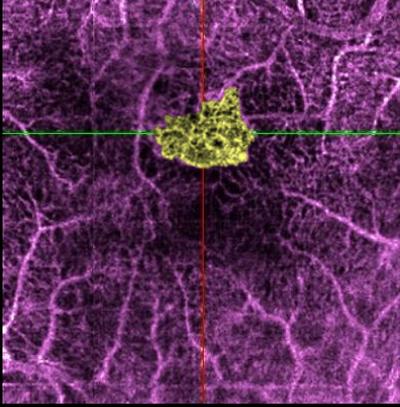

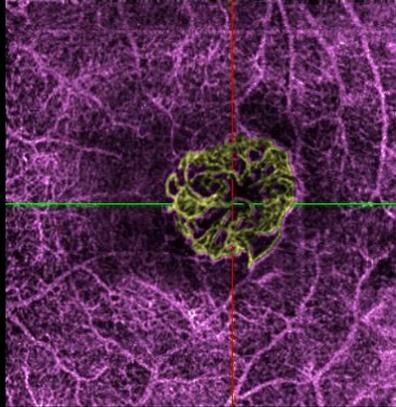

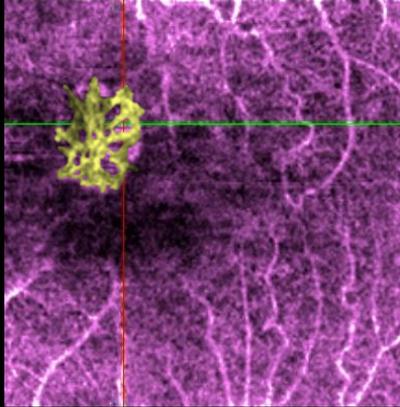

CNV Classification based on location:

- Type 1: below RPE (Jung and Freund AJO 2014)
- Type 2: above RPE
- Type 3: intraretinal
- Type 4: mixed 1-2
- Filamentous (pachychoroid) NVs
- Myopic CNVs
- Residual flow in fibrosis

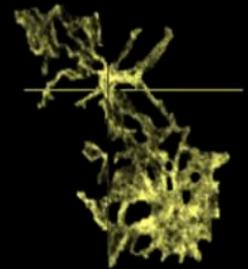

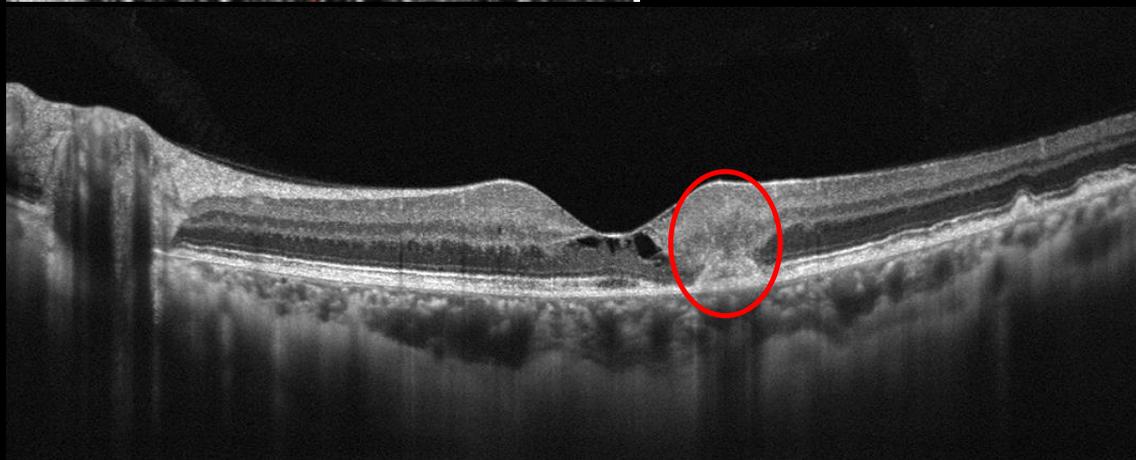

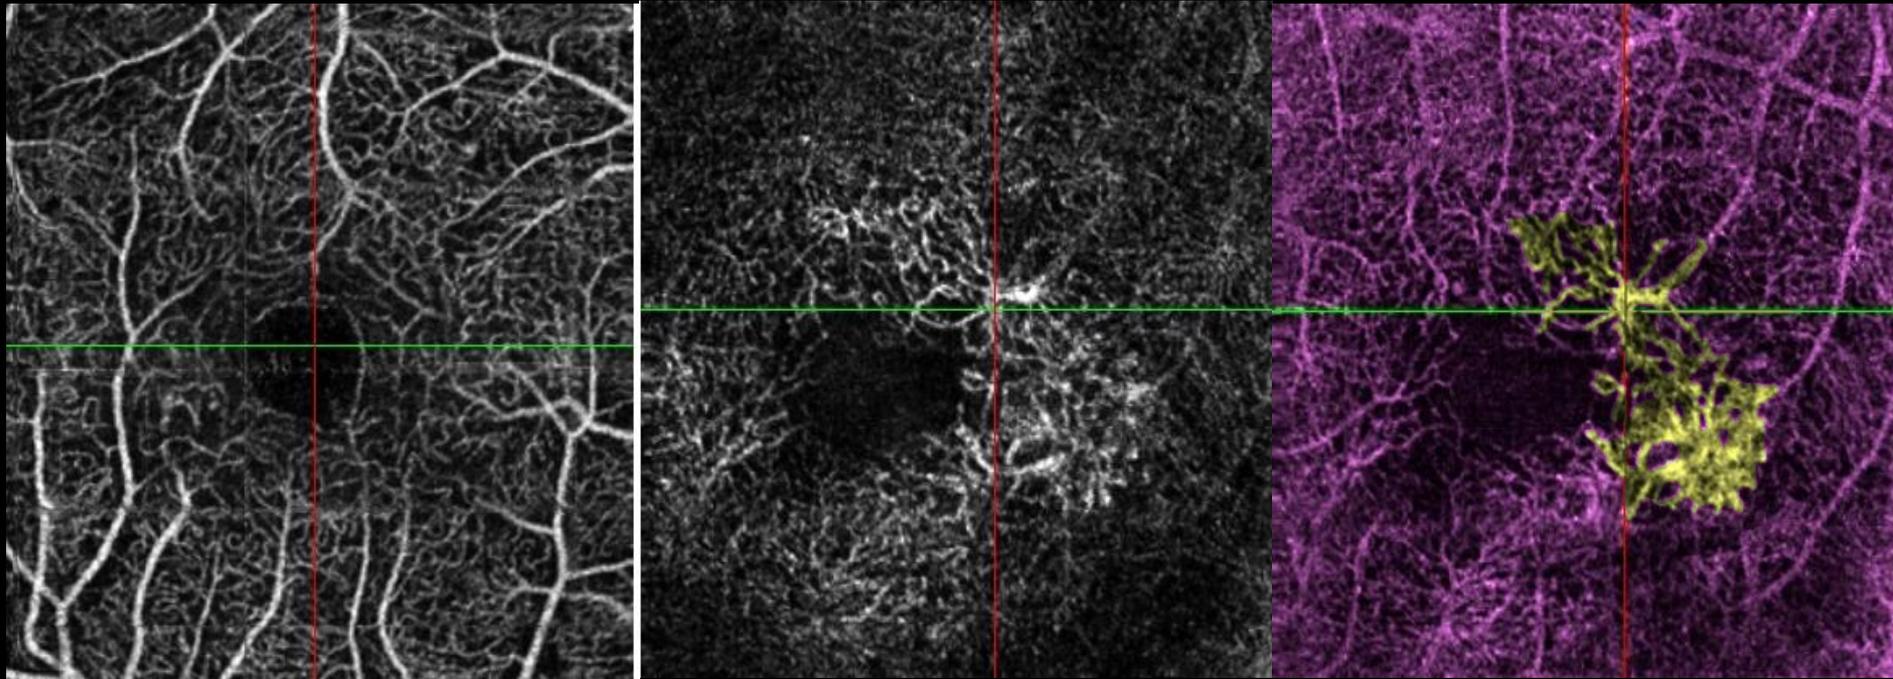

Type 1 CNV: below RPE, wider than type 2, avascular zone usually not involved

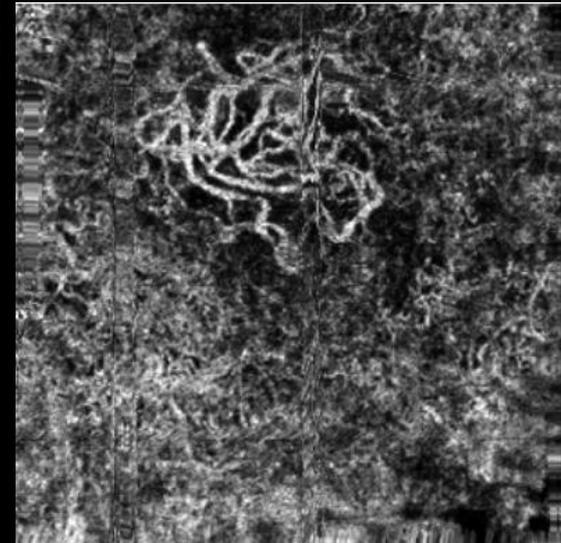

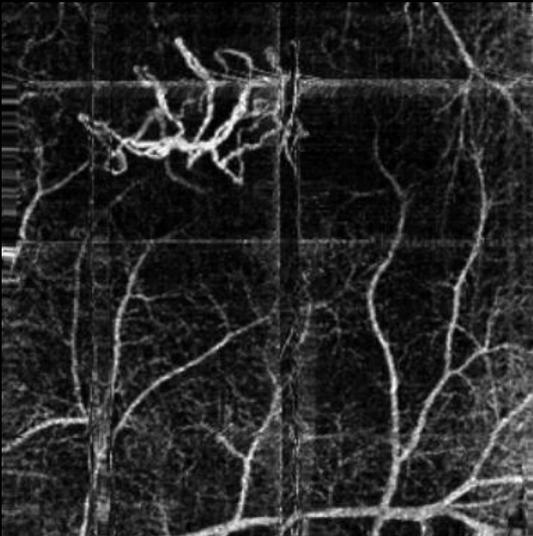

Type 2 CNV: above RPE, smaller than type 1, avascular zone always involved. Very heterogeneous shapes

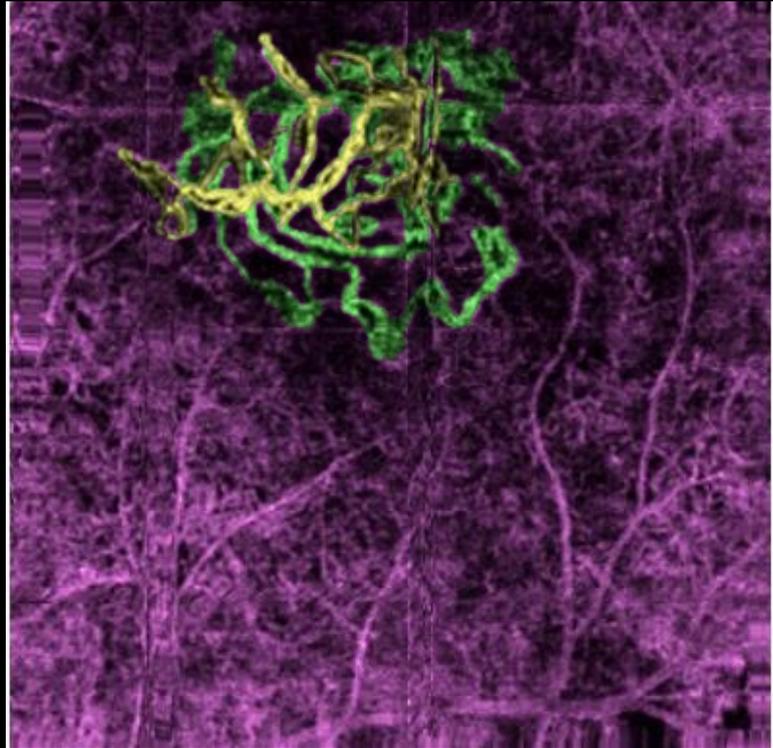

Type 3 NV: intraretinal anastomosis from the deep plexus going toward the RPE

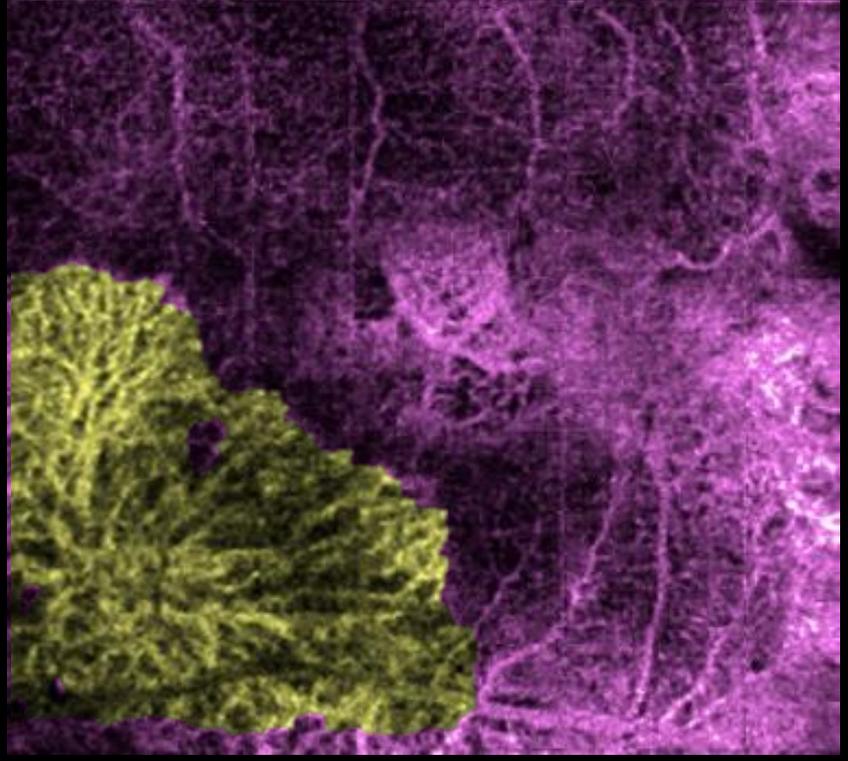

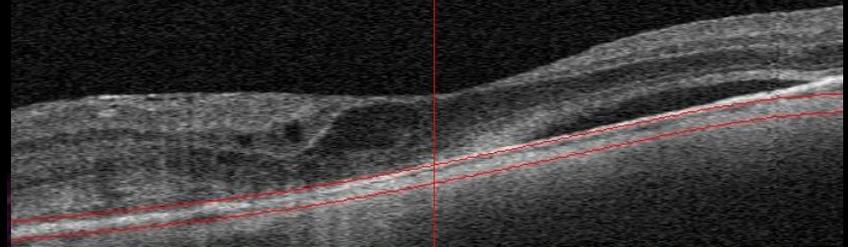

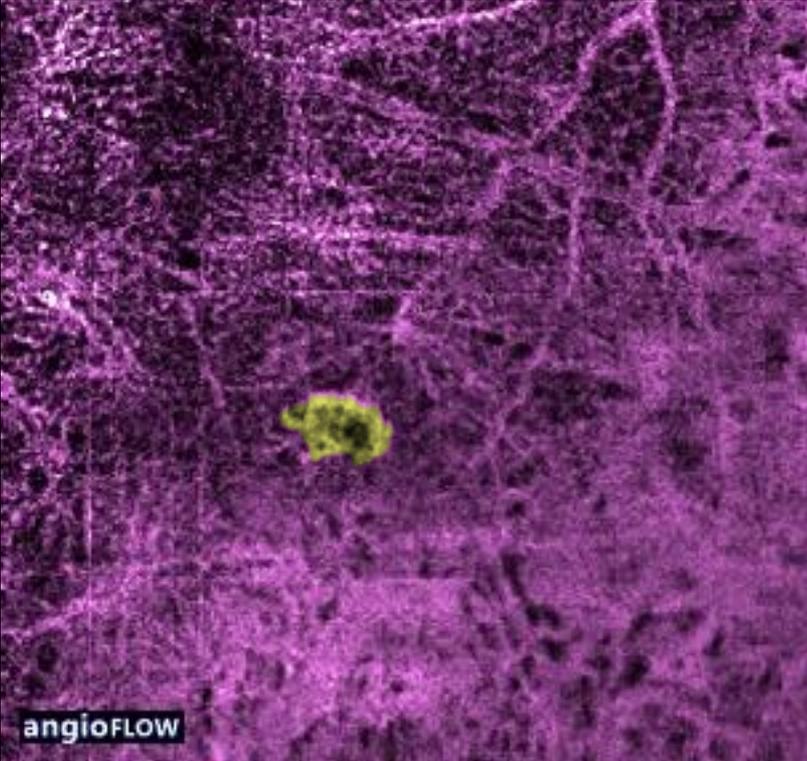

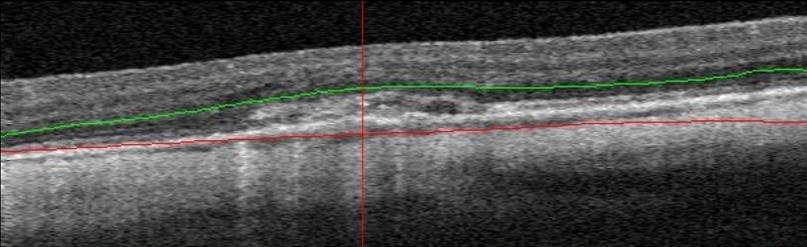

type 4 CNV : initially located below the RPE, NV spread out into the outer retina

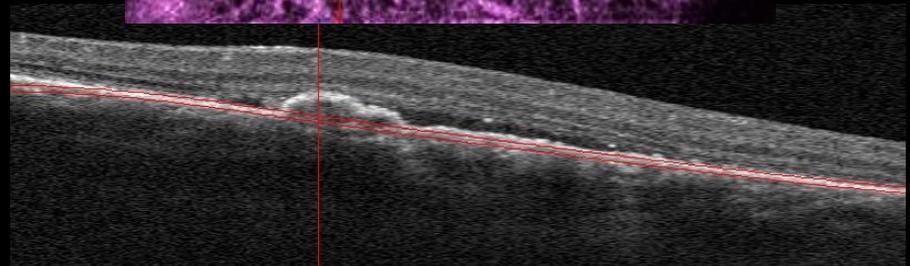

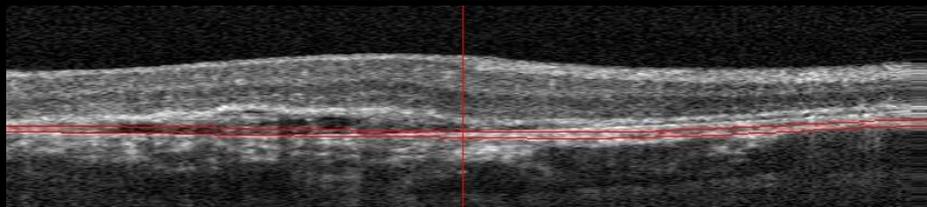

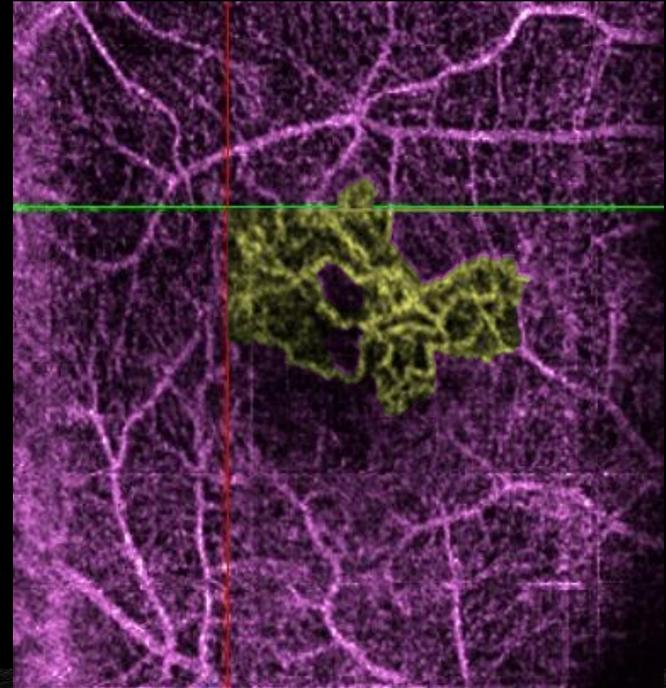

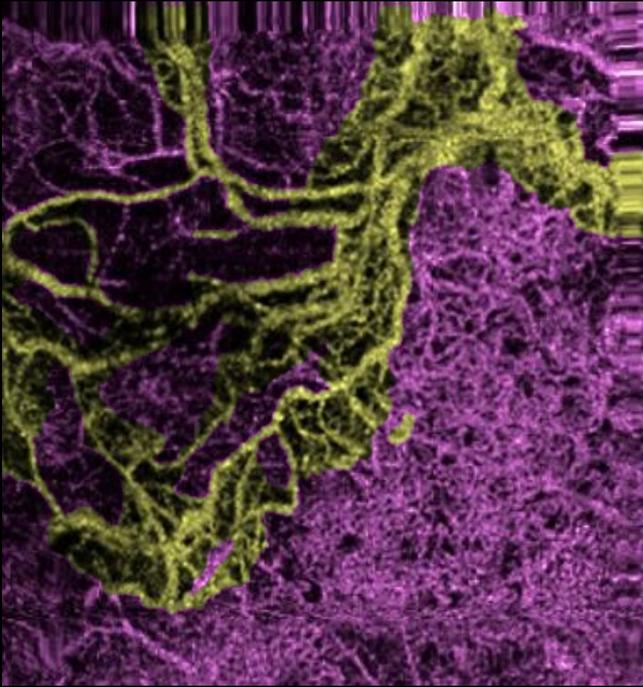

Myopic CNV: start above the RPE and penetrate into avascular zone, usually small size, even if they can get to be much bigger

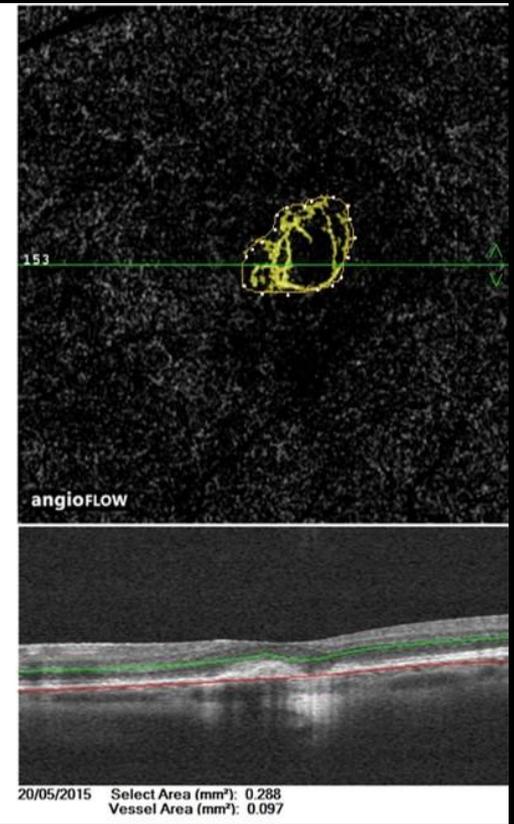

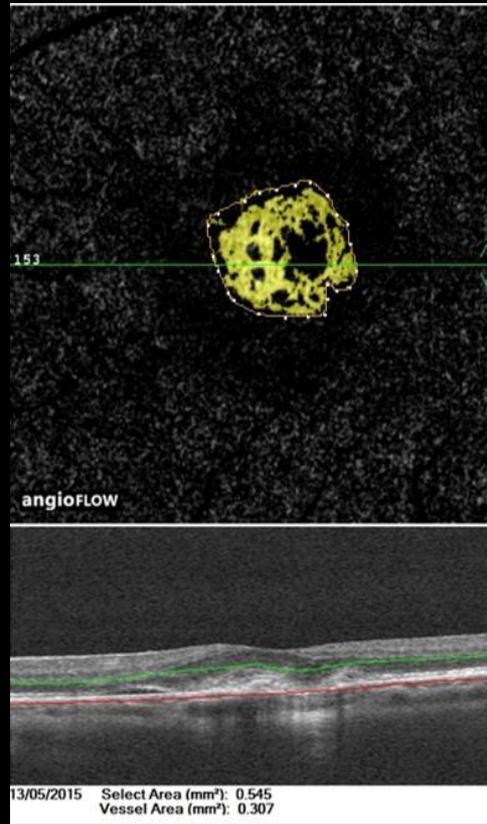

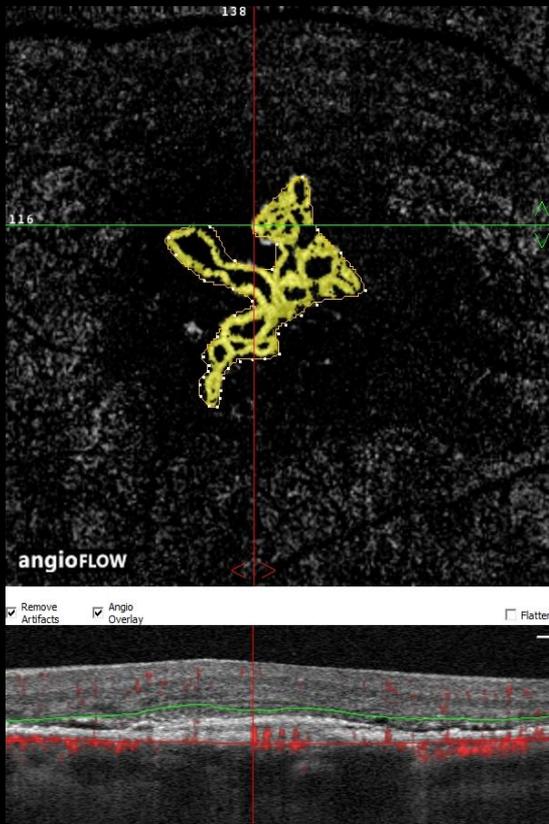

Pachychoroid CNV:

type 1 location, normally large size, no loops, filamentary, tangled

Flow analysis: area quantification and follow up

OCT Angiography

Combination of **functional and quantitative** analysis allow to find the CNV recurrence even two weeks before structural alterations (fluid accumulation, cystic spaces).

We will show two CNV clinical cases followed by OCT Angiography for 19 up to 27 months.

Patients were treated with loading phase, then injected by PRN strategy.

Case 1: VDM

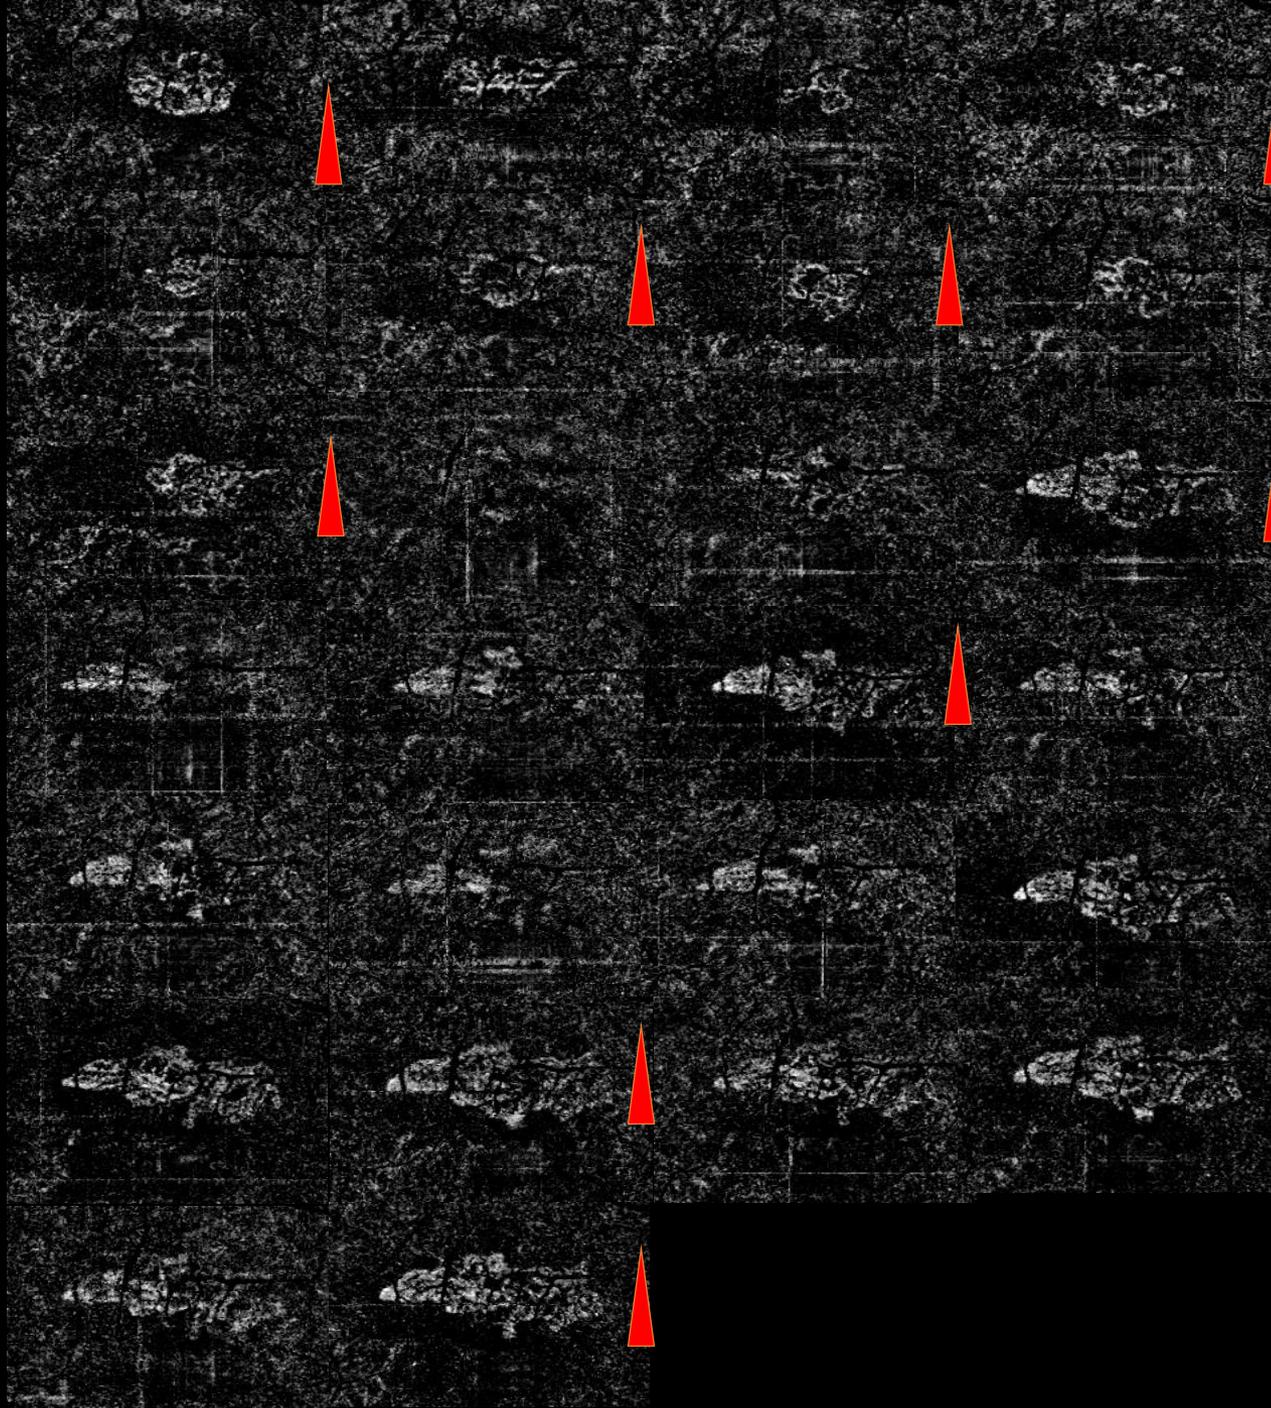

Female, 73 yo

Right eye -2sf

VA 0.6

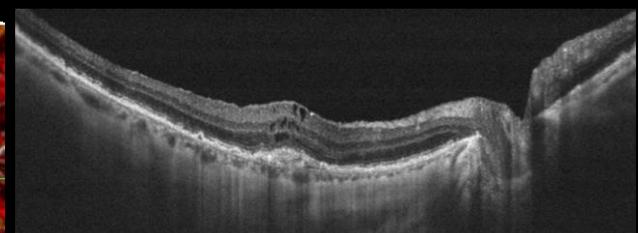

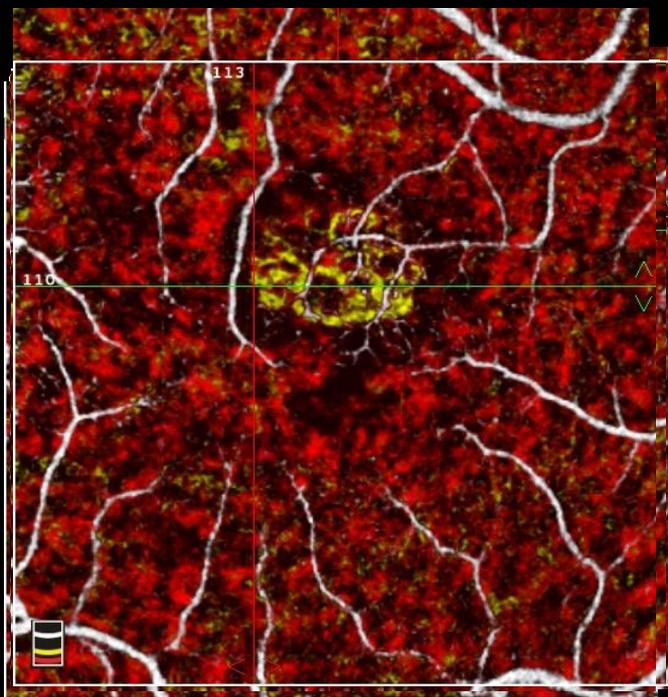

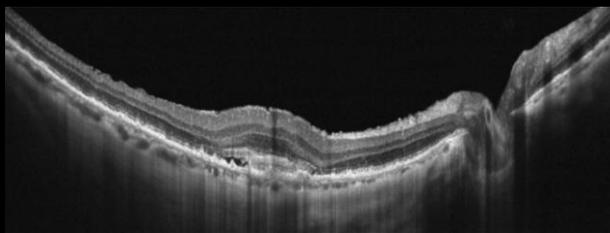

8 injections (4 ranibizumab and 4 aflibercept)

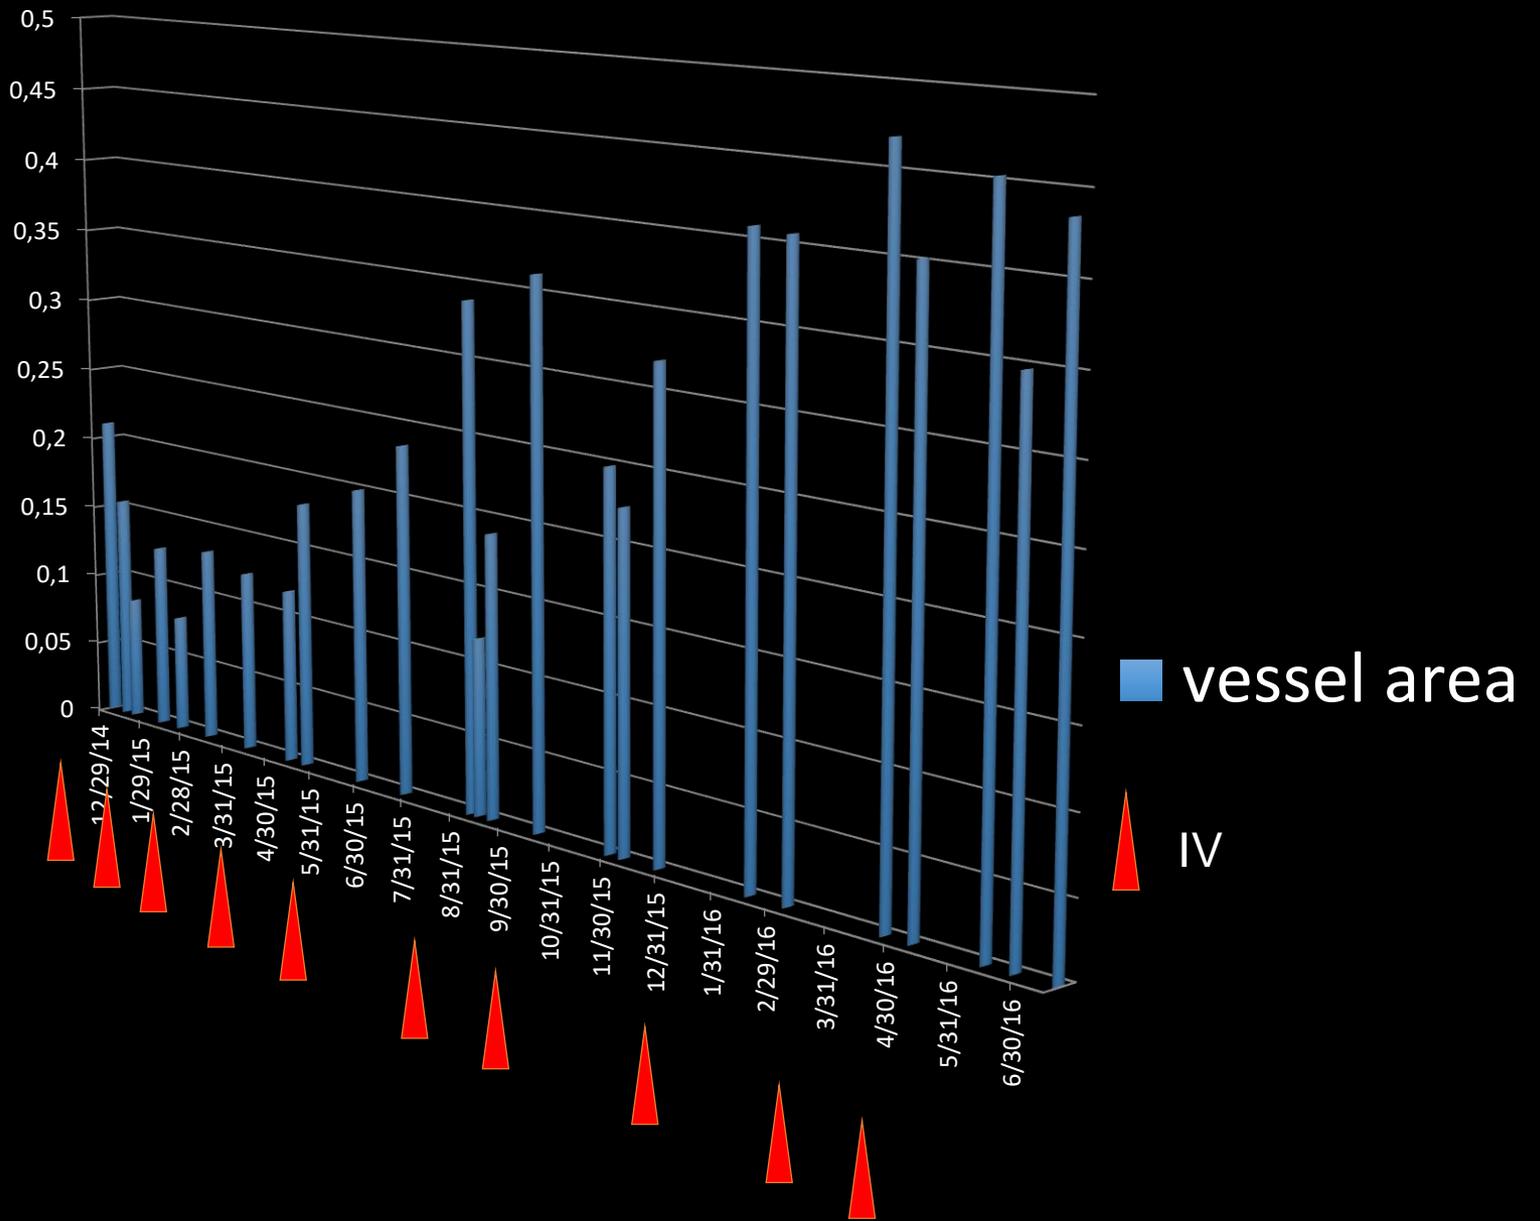

19 months follow up

Time lapse: overall evolution

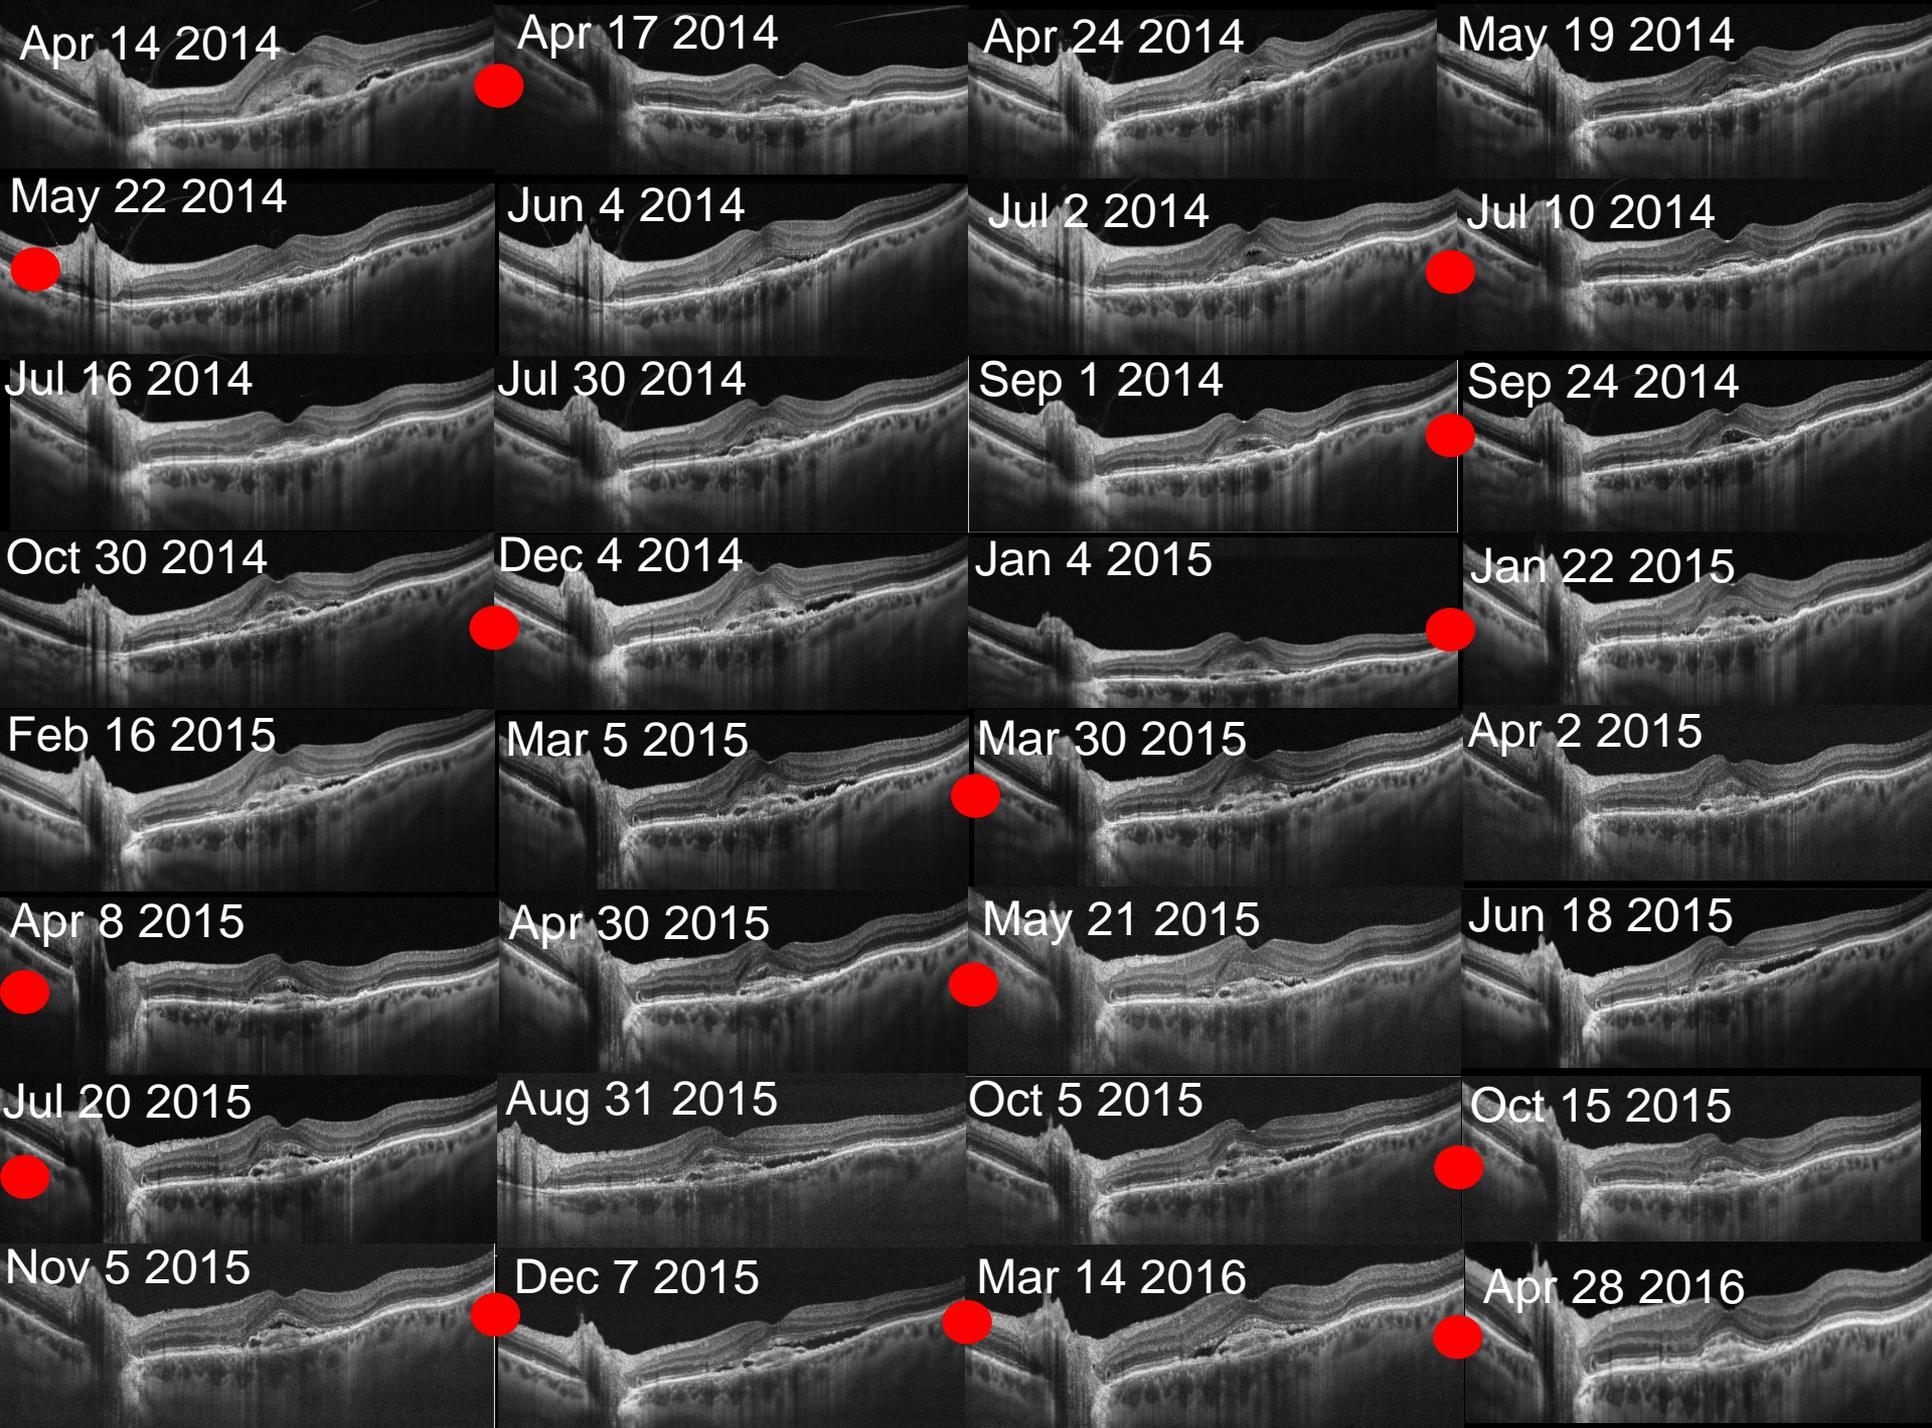

Enhanced CNV: Time evolution

Case 2: MB

- Female 62 yo
- Refraction +2sf
- VA 0,2
- CNV type1/2
- Follow up 27 months
- 15 aflibercept, 1 ranibizumab

Time lapse: overall
evolution

■ vessel area

Conclusions

- CNV start decreasing its activity by 24 hours after IV
- Maximum decrease is between the 7^o and the 12^o day after IV
- CNV reopens after 25-35 days from the last IV
- OCT-A shows “mature” NVs evolution that are less responsive to anti VEGF
- OCT-A allows to locate and anticipate recurrences
- Time lapse examination gives useful data about recurrences

Conclusions

- OCTA introduces new concepts in CNV classification and evolution
- OCTA allows a clearer vision of the capillary network
- OCTA allows a very close follow up managing CNV treatment

Thank you
